

Asterisk Radio Network - ARN

The Asterisk Radio Network is based on the ASTERISK® PBX software package. ASTERISK® PBX has the capability to interconnect communications from and between the following:

- Public Switched Telephone Network (PSTN)
- Internet Telephone (VoIP - SIP, IAX2)
- Radio Communications (Analog and Digital on HF, VHF, UHF, SHF)

Via ASTERISK® PBX these resources can be used to interconnect multiple services for business and public safety communications. With the addition of satellite communications a rapid deployment communications network can be established for event and incident communications support, as well as daily operations.
